Taylor expansion of the flow

Let $\varphi_t(y_0) = y(t)$ be the flow of the ODE

$$y'(t) = F(y(t)), \quad y(0) = y_0, \quad F \in \mathfrak{X}(\mathbb{R}^d).$$

Proposition

The Taylor expansion of the flow is

$$\varphi_t(y_0) = y_0 + ty'(0) + \frac{t^2}{2}y''(0) + \frac{t^3}{3!}y'''(0) + \frac{t^4}{4!}y''''(0) + \dots$$

Taylor expansion of the flow

Let $\varphi_t(y_0) = y(t)$ be the flow of the ODE

$$y'(t) = F(y(t)), \quad y(0) = y_0, \quad F \in \mathfrak{X}(\mathbb{R}^d).$$

Proposition

The Taylor expansion of the flow is

$$\varphi_t = \text{id} + tF + \frac{t^2}{2} DF \cdot F + \frac{t^3}{3!} D(DF \cdot F) \cdot F + \frac{t^4}{4!} D(D(DF \cdot F) \cdot F) \cdot F + \dots$$

Taylor expansion of the flow

Let $\varphi_t(y_0) = y(t)$ be the flow of the ODE

$$y'(t) = F(y(t)), \quad y(0) = y_0, \quad F \in \mathfrak{X}(\mathbb{R}^d).$$

Proposition

The Taylor expansion of the flow is

$$\varphi_t = \text{id} + tF + \frac{t^2}{2} F \triangleright F + \frac{t^3}{3!} F \triangleright (F \triangleright F) + \frac{t^4}{4!} F \triangleright (F \triangleright (F \triangleright F)) + \dots$$

where $F \triangleright G = DG \cdot F = G'F = \langle \nabla G, F \rangle$.

Taylor expansion of the flow

Let $\varphi_t(y_0) = y(t)$ be the flow of the ODE

$$y'(t) = F(y(t)), \quad y(0) = y_0, \quad F \in \mathfrak{X}(\mathbb{R}^d).$$

Proposition

The Taylor expansion of the flow is

$$\varphi_t = \text{id} + tF + \frac{t^2}{2} F \triangleright F + \frac{t^3}{3!} F \triangleright (F \triangleright F) + \frac{t^4}{4!} F \triangleright (F \triangleright (F \triangleright F)) + \dots$$

where $F \triangleright G = DG \cdot F = G'F = \langle \nabla G, F \rangle$.

The Hessian is symmetric (**pre-Lie identity**):

$$\begin{aligned} D^2F(G, H) &= H \triangleright (G \triangleright F) - (H \triangleright G) \triangleright F \\ &= G \triangleright (H \triangleright F) - (G \triangleright H) \triangleright F. \end{aligned}$$

Question: How to understand the elements generated by $(\{F\}, \triangleright)$?

$$\text{Span}_{\mathbb{R}}(F, F \triangleright F, F \triangleright (F \triangleright F), (F \triangleright F) \triangleright F, \dots)$$

The free pre-Lie algebra of Butcher trees

Idea: We have an **object** and a **product** .

The free pre-Lie algebra of Butcher trees

Idea: We have an **object** and a **product** .

Definition

A Butcher tree $\tau \in T$ is defined by induction as

$$\bullet \in T, \quad (\tau_1 \cdots \tau_n) \curvearrowright \bullet \in T, \quad \tau_1, \dots, \tau_n \in T,$$

The grafting product \curvearrowright yields:  \curvearrowright  =  + ,  \curvearrowright  =  + .

The first trees are $T = \{ \bullet, \begin{array}{c} \bullet \\ | \\ \bullet \end{array}, \begin{array}{c} \bullet \\ | \\ \bullet \\ | \\ \bullet \end{array}, \begin{array}{c} \bullet \\ / \ \backslash \\ \bullet \ \bullet \end{array}, \begin{array}{c} \bullet \\ | \\ \bullet \\ | \\ \bullet \\ | \\ \bullet \end{array}, \begin{array}{c} \bullet \\ / \ \backslash \\ \bullet \ \bullet \\ / \ \backslash \\ \bullet \ \bullet \end{array}, \begin{array}{c} \bullet \\ | \\ \bullet \\ | \\ \bullet \\ / \ \backslash \\ \bullet \ \bullet \end{array}, \begin{array}{c} \bullet \\ / \ \backslash \\ \bullet \ \bullet \\ / \ \backslash \\ \bullet \ \bullet \end{array}, \dots \}.$

The free pre-Lie algebra of Butcher trees

Idea: We have an **object** and a **product** .

Definition

A Butcher tree $\tau \in T$ is defined by induction as

$$\bullet \in T, \quad (\tau_1 \cdots \tau_n) \curvearrowright \bullet \in T, \quad \tau_1, \dots, \tau_n \in T,$$

The grafting product \curvearrowright yields:  \curvearrowright  =  + ,  \curvearrowright  =  + .

The first trees are $T = \{\bullet, \bullet, \bullet, \bullet, \bullet, \bullet, \bullet, \bullet, \dots\}$.

Theorem (Chapoton, Livernet, 2001)

The free *pre-Lie* algebra is (T, \curvearrowright) :

"any *pre-Lie* structure (X, \triangle) can be represented using trees".

The free pre-Lie algebra of Butcher trees

Example: the map $\mathbb{F}^{tF} : T \rightarrow \mathfrak{X}(\mathbb{R}^d)$ translates between structures:

F	
$F \triangleright F$	 = 
$F \triangleright (F \triangleright F)$	 =  + 
$(F \triangleright F) \triangleright F$	 = 

Application: The flow satisfies

$$\begin{aligned}
 \varphi_t &= \text{id} + tF + \frac{t^2}{2} F \triangleright F + \frac{t^3}{3!} F \triangleright (F \triangleright F) + \frac{t^4}{4!} F \triangleright (F \triangleright (F \triangleright F)) + \dots \\
 &= \text{id} + \mathbb{F}^{tF} \left(\bullet + \frac{1}{2} \begin{array}{c} \bullet \\ | \\ \bullet \end{array} + \frac{1}{6} \left(\begin{array}{c} \bullet \\ | \\ \bullet \\ | \\ \bullet \end{array} + \begin{array}{c} \bullet \quad \bullet \\ \diagdown \quad / \\ \bullet \end{array} \right) + \frac{1}{24} \left(\begin{array}{c} \bullet \\ | \\ \bullet \\ | \\ \bullet \\ | \\ \bullet \end{array} + \begin{array}{c} \bullet \quad \bullet \\ \diagdown \quad / \\ \bullet \end{array} + 3 \begin{array}{c} \bullet \quad \bullet \\ \diagdown \quad / \\ \bullet \end{array} + \begin{array}{c} \bullet \quad \bullet \quad \bullet \\ \diagdown \quad / \quad \diagdown \quad / \\ \bullet \end{array} \right) + \dots \right) \\
 &= \text{id} + tF + \frac{t^2}{2} DF \cdot F + \frac{t^3}{6} (DF \cdot DF \cdot F + D^2F(F, F)) + \dots
 \end{aligned}$$

Most numerical methods have a Taylor expansion that writes with trees.

Volume-preserving integrators

Consider a "tree numerical method" for solving $y' = F(y)$:

$$y_{n+1} = \Phi_h(y_n) = y_n + \mathbb{F}^{hF}(\bullet + \alpha \mathbf{1} + \beta \mathbf{V} + \dots)(y_n).$$

Example: explicit Euler method $y_{n+1} = y_n + hF(y_n)$.

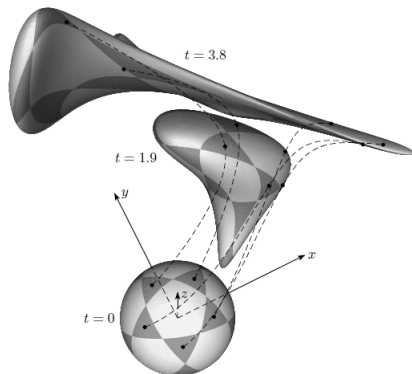

Figure: (from Hairer, Lubich, Wanner, Geometric Numerical Integration)

Volume-preserving integrators

Consider a "tree numerical method" for solving $y' = F(y)$:

$$y_{n+1} = \Phi_h(y_n) = y_n + \mathbb{F}^{hF}(\bullet + \alpha \mathbf{!} + \beta \mathbf{V} + \dots)(y_n).$$

Example: explicit Euler method $y_{n+1} = y_n + hF(y_n)$.

Backward error analysis: the integrator is the **exact solution** of a **modified ODE**

$$\tilde{y}'(t) = \tilde{F}_h(\tilde{y}(t)), \quad h\tilde{F}_h = \mathbb{F}^{hF}(\bullet + \alpha \mathbf{!} + \beta \mathbf{V} + \dots) = hF + \alpha h^2 F \triangleright F + \dots$$

Proposition

A *tree method* is volume preserving if and only if $\text{Div}(\tilde{F}_h) = \text{Div}(F) = 0$.

Volume-preserving integrators

Consider a "tree numerical method" for solving $y' = F(y)$:

$$y_{n+1} = \Phi_h(y_n) = y_n + \mathbb{F}^{hF}(\bullet + \alpha \mathbf{1} + \beta \mathbf{V} + \dots)(y_n).$$

Example: explicit Euler method $y_{n+1} = y_n + hF(y_n)$.

Backward error analysis: the integrator is the **exact solution** of a **modified ODE**

$$\tilde{y}'(t) = \tilde{F}_h(\tilde{y}(t)), \quad h\tilde{F}_h = \mathbb{F}^{hF}(\bullet + \alpha \mathbf{1} + \beta \mathbf{V} + \dots) = hF + \alpha h^2 F \triangleright F + \dots$$

Proposition

A **tree method** is volume preserving if and only if $\text{Div}(\tilde{F}_h) = \text{Div}(F) = 0$.

Theorem (Iserles, Quispel, Tse, 2007; Chartier, Murua, 2007)

*The only consistent volume-preserving **tree method** is the exact flow.*

Question (Munthe-Kaas, Verdier, 2016): does there exist a non-trivial volume-preserving "**aromatic tree method**"?

Aromatic trees

We now have two bricks:  and .

¹Chartier, Murua, 07; Iserles, Quispel, Tse, 07; Bogfjellmo, 19.

Aromatic trees

We now have two bricks:  and .

$\text{div}(F) = \partial_i F^i$	$d_{\bullet} = \bigcirc^i$
$\text{div}(F \triangleright F) = \partial_{ij} F^i \cdot F^j + \partial_j F^i \cdot \partial_i F^j$	$d_{\bullet_i}^j = \bigcirc^i \begin{array}{c} \bullet^j \\ \\ \bullet^i \end{array} + \bigcirc^i \begin{array}{c} \bullet^i \quad \bullet^j \\ \quad \\ \bullet^i \quad \bullet^j \end{array}$
$F \triangleright \text{div}(F) = \partial_{ij} F^i \cdot F^j$	$\bullet_j \curvearrowright \bigcirc^i = \bigcirc^i \begin{array}{c} \bullet^j \\ \\ \bullet^i \end{array}$
$\text{div}(F)^2 = \partial_i F^i \cdot \partial_j F^j$	$\bigcirc^i \bigcirc^j$

¹Chartier, Murua, 07; Iserles, Quispel, Tse, 07; Bogfjellmo, 19.

Aromatic trees

We now have two bricks:  and .

$\operatorname{div}(F) = \partial_i F^i$	$d_{\bullet} = \bigcirc^i$
$\operatorname{div}(F \triangleright F) = \partial_{ij} F^i \cdot F^j + \partial_j F^i \cdot \partial_i F^j$	$d_{\bullet}^{ij} = \bigcirc^i \overset{j}{\bullet} + \bigcirc^i \overset{j}{\bullet}$
$F \triangleright \operatorname{div}(F) = \partial_{ij} F^i \cdot F^j$	$\bullet_j \curvearrowright \bigcirc^i = \bigcirc^i \overset{j}{\bullet}$
$\operatorname{div}(F)^2 = \partial_i F^i \cdot \partial_j F^j$	$\bigcirc^i \bigcirc^j$

Let the aromatic trees¹

$$\mathcal{AT} = \mathcal{A} \otimes \mathcal{T} = \operatorname{Span}_{\mathbb{R}}(\bullet, \overset{i}{\bullet}, \bigcirc_{\bullet}, \overset{i}{\bullet}, \vee, \bigcirc \overset{i}{\bullet}, \bigcirc^i \bullet, \bigcirc \overset{j}{\bullet}, \bigcirc \bigcirc_{\bullet}, \dots)$$

Theorem (Fløystad, Manchon, Munthe-Kaas, 2019)

The free *pre-Lie-Rinehart* algebra "almost" is $(\mathcal{AT}, \curvearrowright, d)$.

¹Chartier, Murua, 07; Iserles, Quispel, Tse, 07; Bogfjellmo, 19.

Aromatic trees

We now have two bricks:  and .

$\text{div}(F) = \partial_i F^i$	$d_{\bullet} = \bigcirc^i$
$\text{div}(F \triangleright F) = \partial_{ij} F^i \cdot F^j + \partial_j F^i \cdot \partial_i F^j$	$d_{\bullet}^{ij} = \bigcirc^i \begin{smallmatrix} \bullet \\ \bullet \end{smallmatrix}^j + \bigcirc^i \begin{smallmatrix} \bullet \\ \bullet \end{smallmatrix}^i$
$F \triangleright \text{div}(F) = \partial_{ij} F^i \cdot F^j$	$\bullet_j \curvearrowright \bigcirc^i = \bigcirc^i \begin{smallmatrix} \bullet \\ \bullet \end{smallmatrix}^j$
$\text{div}(F)^2 = \partial_i F^i \cdot \partial_j F^j$	$\bigcirc^i \bigcirc^j$

Let the aromatic trees¹

$$\mathcal{AT} = \mathcal{A} \otimes \mathcal{T} = \text{Span}_{\mathbb{R}}(\bullet, \begin{smallmatrix} \bullet \\ \bullet \end{smallmatrix}, \bigcirc_{\bullet}, \begin{smallmatrix} \bullet \\ \bullet \\ \bullet \end{smallmatrix}, \nabla, \bigcirc \begin{smallmatrix} \bullet \\ \bullet \end{smallmatrix}, \bigcirc^i_{\bullet}, \bigcirc \begin{smallmatrix} \bullet \\ \bullet \end{smallmatrix}, \bigcirc \begin{smallmatrix} \bullet \\ \bullet \end{smallmatrix}, \bigcirc \begin{smallmatrix} \bullet \\ \bullet \end{smallmatrix}, \bigcirc \begin{smallmatrix} \bullet \\ \bullet \end{smallmatrix}, \dots)$$

Theorem (Fløystad, Manchon, Munthe-Kaas, 2019)

The free *pre-Lie-Rinehart* algebra "almost" is $(\mathcal{AT}, \curvearrowright, d)$.

Goal of volume preservation: Find $\text{Ker}(\text{Div})$ on trees and aromatic trees.

¹Chartier, Murua, 07; Iserles, Quispel, Tse, 07; Bogfjellmo, 19.

Contents

- 1 A whiff of aromatic structures for volume-preservation
- 2 A drop of homological algebra: the aromatic complex
- 3 The essence of aromatic structures in applications

Ker(Div) is non-trivial

Proposition

The simplest element of $\text{Ker}(d)$ is , that is,

$$\text{Div}(F^k \cdot \partial_{jk} F^j \cdot F + \partial_j F^k \cdot \partial_k F^j \cdot F - \partial_k F^k \cdot F^j \cdot \partial_j F - F^k \cdot F^j \cdot \partial_{jk} F) = 0.$$

Ker(Div) is non-trivial

Proposition

The simplest element of $\text{Ker}(d)$ is $\text{circle with dot and top edge} + \text{circle with dot and top edge} - \text{circle with dot and top edge} - \text{Y-shape}$, that is,

$$\text{Div} (F^k \cdot \partial_{jk} F^j \cdot F + \partial_j F^k \cdot \partial_k F^j \cdot F - \partial_k F^k \cdot F^j \cdot \partial_j F - F^k \cdot F^j \cdot \partial_{jk} F) = 0.$$

Proof.

A calculation gives

$$\begin{aligned} d(\text{circle with dot and top edge}) &= \text{Y-shape} + \text{circle with dot and top edge} + \text{circle with dot and top edge}, \\ d(\text{circle with dot and top edge}) &= 2(\text{circle with dot and top edge}) + \text{circle with dot and top edge}, \\ d(\text{circle with dot and top edge}) &= \text{circle with dot and top edge} + \text{circle with dot and top edge} + \text{circle with dot and top edge}, \\ d(\text{Y-shape}) &= 2(\text{circle with dot and top edge}) + \text{Y-shape}. \end{aligned}$$

Hence the result. □

Aromatic forms

Idea: the *De Rham complex* is **exact**: $\operatorname{div}(X) = 0 \Leftrightarrow X = \operatorname{curl}(Y)$.

$$\Omega_0(\mathbb{R}^3) \xrightarrow{\nabla} \Omega_1(\mathbb{R}^3) \xrightarrow{\operatorname{curl}} \Omega_2(\mathbb{R}^3) \xrightarrow{\operatorname{div}} \Omega_3(\mathbb{R}^3)$$

Aromatic forms

Idea: the *De Rham complex* is **exact**: $\operatorname{div}(X) = 0 \Leftrightarrow X = \operatorname{curl}(Y)$.

$$\Omega_0(\mathbb{R}^3) \xrightarrow{\nabla} \Omega_1(\mathbb{R}^3) \xrightarrow{\operatorname{curl}} \Omega_2(\mathbb{R}^3) \xrightarrow{\operatorname{div}} \Omega_3(\mathbb{R}^3)$$

Definition (Aromatic forms)

Let aromatic forms in $\Omega^p = \mathcal{A} \otimes \Lambda^p(\mathcal{T})$ and their differential:

$$a\tau_1 \wedge \cdots \wedge \tau_p = \frac{1}{p!} \sum_{\sigma \in \mathcal{S}_p} \varepsilon(\sigma) a\tau_{\sigma(1)} \otimes \cdots \otimes \tau_{\sigma(p)},$$

$$da\tau_1 \otimes \cdots \otimes \tau_p = d(a\tau_p)\tau_1 \otimes \cdots \otimes \tau_{p-1} + \sum_{i=1}^{p-1} a\tau_1 \otimes \cdots \otimes (\tau_p \curvearrowright \tau_i) \otimes \cdots \otimes \tau_{p-1}.$$

Aromatic forms

Idea: the *De Rham complex* is **exact**: $\operatorname{div}(X) = 0 \Leftrightarrow X = \operatorname{curl}(Y)$.

$$\Omega_0(\mathbb{R}^3) \xrightarrow{\nabla} \Omega_1(\mathbb{R}^3) \xrightarrow{\operatorname{curl}} \Omega_2(\mathbb{R}^3) \xrightarrow{\operatorname{div}} \Omega_3(\mathbb{R}^3)$$

Definition (Aromatic forms)

Let aromatic forms in $\Omega^p = \mathcal{A} \otimes \Lambda^p(\mathcal{T})$ and their differential:

$$\begin{aligned}\tau_1 \wedge \tau_2 &= \frac{1}{2} \left(\tau_1 \otimes \tau_2 - \tau_2 \otimes \tau_1 \right), \\ d\tau_1 \otimes \tau_2 &= d(\tau_2)\tau_1 + \tau_2 \curvearrowright \tau_1.\end{aligned}$$

Aromatic forms

Idea: the *De Rham complex* is **exact**: $\operatorname{div}(X) = 0 \Leftrightarrow X = \operatorname{curl}(Y)$.

$$\Omega_0(\mathbb{R}^3) \xrightarrow{\nabla} \Omega_1(\mathbb{R}^3) \xrightarrow{\operatorname{curl}} \Omega_2(\mathbb{R}^3) \xrightarrow{\operatorname{div}} \Omega_3(\mathbb{R}^3)$$

Definition (Aromatic forms)

Let aromatic forms in $\Omega^p = \mathcal{A} \otimes \Lambda^p(\mathcal{T})$ and their differential:

$$\begin{aligned}\tau_1 \wedge \tau_2 &= \frac{1}{2} (\tau_1 \otimes \tau_2 - \tau_2 \otimes \tau_1), \\ d\tau_1 \otimes \tau_2 &= d(\tau_2)\tau_1 + \tau_2 \curvearrowright \tau_1.\end{aligned}$$

Example

For the aromatic form $\bullet \wedge \mathfrak{I}$, we find

$$d\bullet \wedge \mathfrak{I} = \frac{1}{2} \left(\begin{array}{c} \circ \\ \mathfrak{I} \end{array} \bullet + \begin{array}{c} \circ \quad \circ \\ \mathfrak{I} \end{array} \bullet - \begin{array}{c} \circ \\ \mathfrak{I} \end{array} \bullet - \begin{array}{c} \vee \\ \mathfrak{I} \end{array} \bullet \right).$$

The aromatic complex²

Theorem (BL, McLachlan, Munthe-Kaas, Verdier, 2023)

The exterior derivative d satisfies $d^2 = 0$, and the **aromatic complex** is exact.

$$\dots \xrightarrow{d} \Omega^3 \xrightarrow{d} \Omega^2 \xrightarrow{d} \Omega^1 = \mathcal{AT} \xrightarrow{d} \Omega^0 = \mathcal{A}$$

²See also Dotsenko, Laubie, 2025.

The aromatic complex²

Theorem (BL, McLachlan, Munthe-Kaas, Verdier, 2023)

The exterior derivative d satisfies $d^2 = 0$, and the **aromatic complex** is exact.

$$\dots \xrightarrow{d} \Omega^3 \xrightarrow{d} \Omega^2 \xrightarrow{d} \Omega^1 = \mathcal{AT} \xrightarrow{d} \Omega^0 = \mathcal{A}$$

Example

The first elements of $\text{Ker}(\text{Div})$ are

$$2d_{\bullet} \wedge \uparrow = \text{circle with dot and vertical line} + \text{circle with dot and horizontal line} - \text{circle with dot and vertical line} - \text{Y-shape}$$

$$2d_{\bullet} \wedge \uparrow = \text{circle with dot and vertical line} + \text{circle with dot and horizontal line} + \text{circle with dot and horizontal line} - \text{circle with dot and vertical line} - \text{Y-shape} - \text{Y-shape}$$

$$2d_{\bullet} \wedge \vee = \text{circle with dot and Y-shape} + 2 \times \text{circle with dot and horizontal line} + \text{Y-shape} - \text{circle with dot and Y-shape} - 2 \times \text{Y-shape} - \text{Y-shape}$$

$$2d_{\circ} \wedge \uparrow = \text{circle with dot and vertical line} + \text{circle with dot and horizontal line} + \text{circle with dot and vertical line} - \text{circle with dot and vertical line} - \text{circle with dot and vertical line} - \text{circle with dot and Y-shape}$$

The aromatic complex²

Theorem (BL, McLachlan, Munthe-Kaas, Verdier, 2023)

The exterior derivative d satisfies $d^2 = 0$, and the **aromatic complex** is exact.

$$\dots \xrightarrow{d} \Omega^3 \xrightarrow{d} \Omega^2 \xrightarrow{d} \Omega^1 = \mathcal{AT} \xrightarrow{d} \Omega^0 = \mathcal{A}$$

Applications:

- The aromatic complex is an **infinite-dimensional generalisation** of the De Rham complex on jet spaces.
- The quotiented complex is "almost" exact:

$$\dots \xrightarrow{d} \Omega^2 / \text{Div}(F) \xrightarrow{d} \Omega^1 / \text{Div}(F) \xrightarrow{d} \Omega^0 / \text{Div}(F)$$

Corollary

An aromatic Runge-Kutta method cannot be volume-preserving.

- To preserve the volume exactly, one must start with an **ansatz that is exact for linear problems**, such as **exponential methods**.

²See also Dotsenko, Laubie, 2025.

Application: exact samplers for ergodic SDEs?

Overdamped Langevin dynamics in \mathbb{R}^d :

$$dY(t) = -\nabla V(Y(t))dt + dW(t).$$

Ergodicity property:

$$\lim_{T \rightarrow +\infty} \frac{1}{T} \int_0^T \phi(X(s)) ds = \int_{\mathbb{R}^d} \phi(y) \rho_\infty(y) dy \quad \text{almost surely.}$$

Application: exact samplers for ergodic SDEs?

Overdamped Langevin dynamics in \mathbb{R}^d :

$$dY(t) = -\nabla V(Y(t))dt + dW(t).$$

Shardlow, 2006: **there is no general strong or weak stochastic backward error analysis!**

BUT, for ergodic dynamics, the integrator behaves in long time according to the **invariant measure**³ of a modified SDE:

$$d\tilde{Y}(t) = \tilde{F}_h(\tilde{Y}(t))dt + dW(t).$$

Application: exact samplers for ergodic SDEs?

Overdamped Langevin dynamics in \mathbb{R}^d :

$$dY(t) = -\nabla V(Y(t))dt + dW(t).$$

Shardlow, 2006: **there is no general strong or weak stochastic backward error analysis!**

BUT, for ergodic dynamics, the integrator behaves in long time according to the **invariant measure**³ of a modified SDE:

$$d\tilde{Y}(t) = \tilde{F}_h(\tilde{Y}(t))dt + dW(t).$$

Theorem (BL, 2020; Bronasco, BL, 2026)

The modified vector field \tilde{F}_h is built with  and .

A method is invariant-measure-preserving if $(\text{Div} + \langle -\mathcal{F} \rangle)(\tilde{F}_h) = 0$.

Application: exact samplers for ergodic SDEs?

Overdamped Langevin dynamics in \mathbb{R}^d :

$$dY(t) = -\nabla V(Y(t))dt + dW(t).$$

Remark: Four universal building blocks of stochastic geometric integration

	Tree		ODE	GL-equivariant ³
	Aromatic		Volume pres.	GL-equivariant
	Exotic		SDE	O-equivariant ⁴
	Stolonic		Ergodic pres.	O-equivariant

Goal of ergodic preservation (ongoing): Find $\text{Ker}(\text{Div} + \langle -f \rangle)$ on exotic trees and aromatic stolonic exotic trees.

	$x_{-1}^2 x_2 \odot x_{-1} + 2x_{-1} x_0 x_1 \odot x_{-1}$ $-2x_{-1}^2 x_0 x_1 - x_{-1}^3 x_2 - x_0 \odot x_{-1}^2 x_1$	0

Aromatic structures on manifolds

ODE on a manifold \mathcal{M} with frame (E_i) :

$$y'(t) = F(y(t)), \quad F = f^i E_i \in \mathfrak{X}(\mathcal{M}), \quad \operatorname{div}(F) = 0$$

Lie-Euler method: $y_{n+1} = \exp(hf^d(y_n)E_d)y_n$

Aromatic structures on manifolds

ODE on a manifold \mathcal{M} with frame (E_i) :

$$y'(t) = F(y(t)), \quad F = f^i E_i \in \mathfrak{X}(\mathcal{M}), \quad \operatorname{div}(F) = 0$$

Lie-Euler method: $y_{n+1} = \exp(hf^d(y_n)E_d)y_n$

	Aromatic	Planar Aromatic
Geometry	Euclidean	Local Lie group
Connection	$Y \triangleright X = Y[x^i]\partial_i$	$Y \triangleright X = Y[x^i]E_i$
Torsion	$T = 0$	$T(X, Y) = x^i y^j [[E_j, E_i]]_J$
Trees = vector fields		
Aromas = functions		
Universality ⁵	Tracial pre -Lie-Rinehart	Tracial post -Lie-Rinehart
$\mathcal{A} \otimes \mathcal{U}(\operatorname{Lie}_{\mathcal{A}}(\mathcal{A}T))$	Pre -Hopf algebroid	Post -Hopf algebroid ⁶

Remark:

$$\rho(X)(\phi) = X[\phi], \quad \operatorname{div}(X) = E_i[x^i], \quad \tau(u) = u^i, \quad u(E_j) = u^j E_j.$$

⁵see Rahm, 2026 and BL, Munthe-Kaas, Venkatesh, 2026.

⁶see BL, Li, Sheng, 2025.

Aromatic structures on manifolds

ODE on a manifold \mathcal{M} with frame (E_i) :

$$y'(t) = F(y(t)), \quad F = f^i E_i \in \mathfrak{X}(\mathcal{M}), \quad \operatorname{div}(F) = 0$$

Lie-Euler method: $y_{n+1} = \exp(hf^d(y_n)E_d)y_n$

Proposition

Apply the (*order 1*) Lie-Euler method with the *preprocessed vector field*

$$\begin{aligned} h\hat{F}_h &= \mathbb{F}^{hF} \left(\bullet + \frac{1}{2} \begin{array}{c} \bullet \\ | \\ \bullet \end{array} - \frac{1}{3} \begin{array}{c} \bullet \\ | \\ \bullet \\ | \\ \bullet \end{array} - \frac{1}{12} \begin{array}{c} \times \\ \diagup \quad \diagdown \\ \bullet \end{array} \circ \bullet - \frac{1}{12} \begin{array}{c} \times \\ \bullet \\ \times \end{array} \circ \bullet + \frac{1}{6} [\bullet, \bullet] \right) \\ &= hf^i E_i + \frac{h^2}{2} f^j E_j [f^i] E_i - \frac{h^3}{3} f^k E_k [f^j] E_j [f^i] E_i - \frac{h^3}{12} f^k \llbracket E_j, E_k \rrbracket_J [f^j] f^i E_i \\ &\quad - \frac{h^3}{12} E_j [f^k] E_k [f^j] f^i E_i + \frac{h^3}{6} f^k f^j E_j [f^i] \llbracket E_k, E_i \rrbracket_J. \end{aligned}$$

Then, it has *order 2 of convergence* and is *divergence-free of order 3*.

Conclusion

Summary:

- **Volume-preservation** is entirely characterised through **backward error analysis**, **aromatic trees**, and the **aromatic complex**.
- A volume-preserving "aromatic tree method" must be **exact on linear problems**.
- Aromatic structures extend to **many applications**, such as the challenging study of **exact discretisations** for ergodic SDEs, **variational calculus**, **rough paths**, **intrinsic numerics**,...

Conclusion

Outlooks:

- Aromatic structures in **different geometries** + applications (with S. Carrier),
- **Intrinsic stochastic backward error analysis** + applications (with S. Macé),
- Toward **exact sampling** (with V. Dotsenko, P. Laubie, J. Sao Joao) with **stochastic exponential Rosenbrock methods** (with S. Andersen, K. Debrabant, A. Kværnø),
- Application to **diffusion models, rough paths**,... (with P. Catoire, Y. Hou, L. Trémant),
- **ANR MaStoC** (2026-2029) with S. Carrier, N. En-Nebbazi, S. Macé.
